#### Abstract

Let us consider the composed random variable $\eta=\sum_{k=1}^{\nu} \xi_{k}$, where $\xi_{1}, \xi_{2}, \ldots$ are independent identically distributed random variables and $\nu$ is a positive value random, independent of all $\xi_{k}$. In [1] and [2], we gave some the stabilities of the distribution function of $\eta$ in the following sense: the small changes in the distribution function of $\xi_{k}$ only lead to the small changes in the distribution function of $\eta$. In the paper, we investigate the distribution function of $\eta$ when we have the small changes of the distribution of $\nu$.

## 1. Introduction

Let us consider the random variable (r.v):

$$
\begin{equation*}
\eta=\sum_{k=1}^{\nu} \xi_{k} \tag{1}
\end{equation*}
$$

where $\xi_{1}, \xi_{2}, \ldots$ are independent identically distributed random variables with the distribution function $F(x), \nu$ is a positive value r.v independent of all $\xi_{k}$ and $\nu$ has the distribution function $A(x)$.

In [1] and [2], $\eta$ is called to be the composed r.v and $\nu$ is called to be its index r.v. If $\Psi(x)$ is the distribution function of $\eta$ with the characteristic function $\psi(x)$ respecrively then (see [1] or [2])

$$
\begin{equation*}
\psi(x)=a[\varphi(t)] \tag{2}
\end{equation*}
$$

where $a(z)$ is the generating function of $\nu$ and $\varphi(t)$ is the characteristic function of $\xi_{k}$.
In [1] and [2], we gave some the stabilities of $\Psi(x)$ in the following sence: the small changes in the distribution function $F(x)$ only lead to the small changes in the distribution function $\Psi(x)$.

In this paper, we shall investigate the stability of $\eta$ 's distribution function when we have the small change of the distribution of the index r.v $\nu$.

[^0]
## 2. Stability theorem

Let us consider the r.v now:

$$
\begin{equation*}
\eta_{1}=\sum_{k=1}^{\nu_{1}} \xi_{k} \tag{3}
\end{equation*}
$$

where $\nu_{1}$ has the distribution function $A_{1}(x)$ with the generating function $a_{1}(z)$. Suppose $\xi_{k}$ have the stable law with the characteristic function

$$
\begin{equation*}
\varphi(t)=\exp \left\{i \mu t-c|t|^{\alpha}\left[1-e \beta \frac{t}{|t|} \omega(t ; \alpha)\right]\right\} \tag{4}
\end{equation*}
$$

where $c, \mu, \alpha, \beta$ are real number, $c \geq 0 ;|\beta| \leqslant 1$,

$$
\begin{equation*}
2 \geq \alpha \geq \alpha_{1}>1 ; \quad \omega(t ; \alpha)=\operatorname{tg} \frac{\alpha t}{2} \tag{5}
\end{equation*}
$$

For every $\varepsilon>0$ is given, such that

$$
\begin{equation*}
\varepsilon<\left(\frac{\pi}{3 c_{2}}\right)^{3} \tag{6}
\end{equation*}
$$

where $c_{2}=\left(c+c|\beta|\left|\operatorname{tg} \frac{\alpha_{1} \pi}{2}+|\mu|\right)\right.$.
We have the following theorem:
Theorem 2.1 (Stability Theorem). Assume that

$$
\begin{gather*}
\rho\left(A ; A_{1}\right)=\sup _{x \in R^{1}}\left|A(x)-A_{1}(x)\right| \leqslant \varepsilon \\
\mu_{A}^{\alpha}=\int_{0}^{+\infty} z^{\alpha} d A(z)<+\infty ; \quad \mu_{A_{1}}^{\alpha}=\int_{0}^{+\infty} z^{\alpha} d A_{1}(z)<+\infty, \quad \forall \alpha>0 \tag{7}
\end{gather*}
$$

Then we have

$$
\rho\left(\Psi, \Psi_{1}\right) \leqslant K_{1} \varepsilon^{1 / 6}
$$

where $K_{1}$ is a constant independent of $\varepsilon, \Psi(x)$ and $\Psi_{1}(x)$ are the distribution function of $\eta$ and $\eta_{1}$ respectively.
Lemma 2.1. Let $a$ is a complex number, $a=\rho e^{i \theta}$, such that $|\theta| \leqslant \frac{\pi}{3} ; 0 \leqslant \rho \leqslant 1$. Then we have the following estimation:

$$
\begin{equation*}
\left|a^{\ell}-1\right| \leqslant \frac{\sqrt{14}|a-1|}{(1-|a-1|)} \quad(\text { forevery } t>0) \tag{8}
\end{equation*}
$$

Proof. Since $a=\rho(\cos \theta+i \sin \theta)$, it follows that $a^{t}=\rho^{t}(\cos t \theta+i \sin t \theta)$.
Hence

$$
\begin{equation*}
\left|a^{t}-1\right|^{2}=\left(\rho^{t} \cos t \theta-1\right)^{2}+\left(\rho^{t} \sin t \theta\right)^{2} \tag{9}
\end{equation*}
$$

we also have

$$
\left(\rho^{t} \cos t \theta-1\right)=\left(\rho^{t}-1\right) \cos t \theta+(\cos t \theta-1)
$$

Notice that $|1-\cos x| \leqslant|x|$ for all $x$, thus

$$
\left|\rho^{t} \cos t \theta-1\right| \leqslant\left|\rho^{t}-1\right|+|t \theta| .
$$

On the other hand, since $|\sin u| \leqslant|u|$ for all $u$,

$$
\begin{equation*}
\left|a^{t}-1\right|^{2} \leqslant 2\left|\rho^{t}-1\right|^{2}+2 t^{2} \theta^{2}+\rho^{2 t} t^{2} \theta^{2} \tag{10}
\end{equation*}
$$

we can see

$$
|a-1|^{2}=(\rho \cos \theta-1)^{2}+\left(\rho^{2} \sin ^{2} \theta\right)
$$

It follows that

$$
\begin{equation*}
|\rho \sin \theta| \leqslant|a-1| . \tag{11}
\end{equation*}
$$

Furthermore,

$$
||a|-1| \leqslant|a-1| \Rightarrow|\rho-1| \leqslant|a-1| \Rightarrow \rho \geq 1-|a-1| .
$$

From (11) we obtain

$$
\begin{equation*}
|\sin \theta| \leqslant \frac{|a-1|}{\rho} \leqslant \frac{|a-1|}{1-|a-1|} \tag{12}
\end{equation*}
$$

Since $|\theta| \leqslant \frac{\pi}{3} \Rightarrow|\sin \theta| \geq \frac{|\theta|}{2}$, so that

$$
\begin{equation*}
|\theta| \leqslant \frac{2|a-1|}{(1-|a-1|)} . \tag{13}
\end{equation*}
$$

From (10) and (13), we have

$$
\begin{equation*}
\left|a^{t}-1\right|^{2} \leqslant 2\left|\rho^{t}-1\right|^{2}+\frac{8 t^{2}|a-1|^{2}}{(1-|a-1|)^{2}}+4 \frac{\rho^{2 t} t^{2}|a-1|^{2}}{(1-|a-1|)^{2}} \tag{14}
\end{equation*}
$$

For all $t \geq 0$, the following inequality holds:

$$
\begin{equation*}
1-\rho^{t} \leqslant \frac{t(1-\rho)}{\rho} \tag{15}
\end{equation*}
$$

Using (11) and notice that $|1-\rho|=|1-|a|| \leqslant|a-1|$, we shall have

$$
\begin{equation*}
1-\rho^{t} \leqslant \frac{t|a-1|}{\rho} \tag{16}
\end{equation*}
$$

Hence by (14) we get

$$
\left|a^{t}-1\right|^{2} \leqslant \frac{14 t^{2}|a-1|^{2}}{(1-|a-1|)^{2}}
$$

Lemma 2.2. Under the notation in (2), let $\delta(\varepsilon)$ be sufficiently small postive number such that $\delta(\varepsilon) \rightarrow 0$ when $\varepsilon \rightarrow 0$ and

$$
|\arg \varphi(t)| \leqslant \frac{\pi}{3} \quad \forall t, \quad|t| \leqslant \delta(\varepsilon)
$$

Then

$$
\left|\psi(t)-\psi_{1}(t)\right| \leqslant C|t| \quad \forall t, \quad|t| \leqslant \delta(\varepsilon)
$$

where $C$ is a constant independent of $\varepsilon$ and $\psi_{1}(t)$ is the characteristic function with the distribution function $\Psi_{1}(t)$ respectively.
Proof. We have

$$
\begin{equation*}
\left|\psi(t)-\psi_{1}(t)\right|=\left.\left|\int_{0}^{+\infty}\right| \varphi(t)\right|^{2} d\left[A(z)-A_{1}(z)\right]\left|\leqslant \int_{0}^{+\infty}\right| \varphi^{z}(t)-1 \mid d\left[A(z)+A_{1}(z)\right] . \tag{17}
\end{equation*}
$$

Notice that, for all $t \in R^{1}$

$$
\left|e^{i t x}-1\right| \leqslant 3\left|\sin \left(\frac{t x}{2}\right)\right| \leqslant \frac{3}{2}|t x|<2|t x|
$$

Hence, if we put

$$
\mu_{F}=\int_{-\infty}^{+\infty}|x| d F(x)<+\infty ; \quad \varphi(t)=\int_{-\infty}^{+\infty} e^{i t x} d F(x)
$$

then

$$
|\varphi(t)-1| \leqslant \int\left|e^{i t x}-1\right| d F<2|t| \mu_{F} .
$$

From lemma 2.1, (with $a=\varphi(t) ;|t| \leqslant \delta(\varepsilon)$ )

$$
\begin{equation*}
|\varphi(t)-1| \leqslant \frac{\sqrt{14} z|\varphi(t)-1|}{(1-|\varphi(t)-1|)} \tag{18}
\end{equation*}
$$

Because there exits moments (from (7)) and with $t,|t| \leqslant \delta(\varepsilon)$ we can see $|1-\varphi(t)| \leqslant \frac{1}{2}$, therefore

$$
\left|\psi(t)-\psi_{1}(t)\right| \leqslant \int_{0}^{+\infty} \frac{\sqrt{14} z|\varphi(t)-1|}{(1-|\varphi(t)-1|)} d\left[A(z)+A_{1}(z)\right] \leqslant 4 \sqrt{14} \mu_{F}\left(\mu_{A}+\mu_{A_{1}}\right)|t|=C|t|
$$

(do $\left.|\varphi(t)-1| \leqslant \mu_{F}|t| \quad \forall t\right)$
where $C$ is a constant independent of $\varepsilon$ and $\mu_{F}=\int_{-\infty}^{+\infty}|x| d F(x)<\infty$.
Proof of Theorem 2.1.

$$
\begin{align*}
& \text { For every } N>0 \text { and } t \in R^{1}, \text { we have } \\
& \begin{array}{c}
\left|\psi(t)-\psi_{1}(t)\right|=\left|\int_{0}^{+\infty} \varphi^{z}(t) d\left[A(z)-A_{1}(z)\right]\right| \\
\leqslant\left|\int_{0}^{N} \varphi^{z}(t) d\left[A(z)-A_{1}(z)\right]\right|+\left|\int_{N}^{+\infty} \varphi^{z}(t) d\left[A(z)-A_{1}(z)\right]\right| \\
\leqslant \\
\left.\leqslant A(z)-A_{1}(z)\right]\left.\right|_{0} ^{N}\left|+\int_{0}^{N}\right| A(z)-A_{1}(z)\left\|\varphi^{z}(t)\right\| \ln \varphi(t) \mid d z+\int_{N}^{+\infty} d\left[A(z)+A_{1}(z)\right] \\
=I_{1}+I_{2}+I_{3}
\end{array}
\end{align*}
$$

First, it casy to see that

$$
\begin{equation*}
I_{1} \leqslant 2 \varepsilon \tag{20}
\end{equation*}
$$

In order to estimate $I_{2}$, notice that $\varphi(t)$ has form (4) with the condition (5) so we have

$$
\begin{equation*}
|\ln \varphi(t)| \leqslant|\mu||t|+|t|^{\alpha}\left(c+c|\beta|\left|t g \frac{\alpha \pi}{2}\right|\right) \leqslant|\mu||t|+C_{1}|t|^{\alpha} \tag{21}
\end{equation*}
$$

where $C_{1}=c+c|\beta|\left|\operatorname{tg} \frac{\alpha \pi}{2}\right| \leqslant c+c|\beta|\left|\operatorname{tg} \frac{\alpha_{1} \pi}{2}\right|$.
If $T=T(\varepsilon)$ is a positive number which will be chosen later $(T(\varepsilon) \rightarrow \infty$ when $\varepsilon \rightarrow 0$ ), we can see that

$$
|\ln \varphi(t)| \leqslant|\mu| T+C_{1} T^{\alpha} \leqslant\left(C_{1}+|\mu|\right) T^{\alpha} \leqslant C_{2} T^{\alpha} \quad \forall t,|t| \leqslant T(\varepsilon)
$$

where $C_{2}=c+c|\beta|\left|t g \frac{\alpha_{1} \pi}{2}\right|+|\mu| ; \quad\left(\alpha \geq \alpha_{1}>1\right)$.
Then

$$
\begin{equation*}
I_{2} \leqslant \varepsilon \int_{0}^{N} C_{2} T^{\alpha} d z \leqslant C_{2} \varepsilon T^{\alpha} N \tag{22}
\end{equation*}
$$

Finally, with $\alpha$ from condition (5), we have

$$
\begin{equation*}
I_{3} \leqslant \frac{\mu_{A}^{\alpha}+\mu_{A_{1}}^{\alpha}}{N^{\alpha}} \tag{23}
\end{equation*}
$$

By using (19), (20), (21), (23), we conclude that

$$
\begin{equation*}
\left|\psi(t)-\psi_{1}(t)\right| \leqslant 2 \varepsilon+C_{2} \varepsilon T^{\alpha} N+\frac{\mu_{A}^{\alpha}+\mu_{A_{1}}^{\alpha}}{N^{\alpha}} \tag{24}
\end{equation*}
$$

Choosing $T=\varepsilon^{-\frac{1}{3^{\alpha}}}$ and $N=T=\varepsilon^{-\frac{1}{3^{\alpha}}}$, we can see that

$$
\begin{aligned}
& C_{2} \varepsilon T^{\alpha} N \leqslant C_{2} \varepsilon^{1-\frac{1}{3}-\frac{1}{3}}=C_{2} \varepsilon \frac{1}{3} \\
& \left(\mu_{A}^{\alpha}+\mu_{A_{1}}^{\alpha}\right) N^{-\alpha}=\left(\mu_{A}^{\alpha}+\mu_{A_{1}}^{\alpha}\right) \varepsilon^{\frac{1}{3}}
\end{aligned}
$$

Thus

$$
\begin{equation*}
\left|\psi(t)-\psi_{1}(t)\right| \leqslant 2 \varepsilon+C_{2} \varepsilon^{\frac{1}{3}}+\left(\mu_{a}^{\alpha}+\mu_{A_{1}}^{\alpha}\right) \varepsilon^{\frac{1}{3}}=C_{3} \varepsilon^{\frac{1}{3}} \tag{25}
\end{equation*}
$$

for every $t$ with $|t| \leqslant T=\varepsilon^{-\frac{1}{3^{\alpha}}}$ and $C_{3}$ is a constant independent of $\varepsilon$.
For all $\delta(\varepsilon)>0$, we consider now

$$
\int_{-T}^{T}\left|\frac{\varphi(t)-\varphi_{1}(t)}{t}\right| d t=\int_{-\delta(\varepsilon)}^{\delta(\varepsilon)}\left|\frac{\varphi(t)-\varphi_{1}(t)}{t}\right| d t+\int_{\delta(\varepsilon) \leqslant|t| \leqslant T}\left|\frac{\varphi(t)-\varphi_{1}(t)}{t}\right| d t
$$

Since

$$
\ln z=\ln |z|+\operatorname{iarg}(z) \quad(0 \leqslant \arg z \leqslant 2 \pi)
$$

for all complex number $z$, letting $z=\varphi(t), \quad(|t| \leqslant \delta(\varepsilon))$

$$
|\arg \varphi(t)| \leqslant|\ln \varphi(t)| \leqslant C_{2} \delta(\varepsilon)
$$

with $\delta(\varepsilon)=\varepsilon^{\frac{1}{3}}$, we shall gct $|\arg \varphi(t)| \leqslant C_{2} \varepsilon^{\frac{1}{3}}$ and from (6)

$$
C_{2} \varepsilon \frac{1}{3} \leqslant \frac{\pi}{3} \Rightarrow|\arg \varphi(t)| \leqslant \frac{\pi}{3} \text { for every } t, \quad|t| \leqslant \delta \varepsilon
$$

Hence, using lemma 2.2, we obtain:

$$
\begin{equation*}
\int_{-\delta(\varepsilon)}^{\delta(\varepsilon)}\left|\frac{\varphi(t)-\varphi_{1}(t)}{t}\right| d t \leqslant 2 C \delta(\varepsilon)=2 C \varepsilon^{\frac{1}{3}} \tag{26}
\end{equation*}
$$

On the other hand, using (25), we get

$$
\begin{equation*}
\int_{\delta(\varepsilon) \leqslant|t| \leqslant T}\left|\frac{\varphi(t)-\varphi_{1}(t)}{t}\right| d t \leqslant C_{3} \varepsilon^{\frac{1}{3}} \int_{\delta(\varepsilon)}^{T} \frac{d t}{t}=C_{3} \varepsilon^{\frac{1}{3}} \ln \frac{T}{\delta(\varepsilon)}=C_{3} \varepsilon^{\frac{1}{3}} \ln \left(\frac{1}{\frac{1+\alpha}{3 \alpha}}\right) \leqslant C_{4} \varepsilon^{\frac{1}{6}} \tag{27}
\end{equation*}
$$

From (26) and (27)

$$
\int_{-T}^{T}\left|\frac{\varphi_{0}(t)-\varphi_{1}(t)}{t}\right| d t \leqslant 2 C \varepsilon \frac{1}{3}+C_{4} \varepsilon \frac{1}{6} \leqslant C_{5} \varepsilon \frac{1}{6}
$$

where $C_{5}$ is constant independent of $\varepsilon$.
Indecd, by using Essen's inequality (see [3]) we have

$$
\rho\left(\Psi ; \Psi_{1}\right) \leqslant C_{5} \varepsilon^{\frac{1}{6}}+C_{6} \varepsilon^{\frac{1}{4}} \leqslant K_{1} \varepsilon^{\frac{1}{6}}
$$

where $K_{1}$ is a constant independent of $\varepsilon$.
